

» 功率组件 | Power Assemblies

The power regulating equipment designed and manufactured with power electronics components with the advantages of simple selection, high reliability, low comprehensive cost, easy installation, nice appearance, fast development speed, and etc.

The power assemblies made of thyristor and diode which are available to be supplied:

- Single-phase rectifier bridge series: including single-phase full control, half control, and rectifier bridge.
- Three-phase full-bridge series: including three-phase full control rectification, three-phase half control rectification, and three-phase rectification bridge.
- Six-phase rectifier bridge series: including six-phase controllable and uncontrollable rectifier bridges.
- AC switch series: including single-phase and three-phase AC switches.

For more questions of power assemblies made of thyristor, diode and rectifier for rectification, converting, power switch and control, please consult us, a customer support team with talent and experienced technicians is under serving.

- Cooling modes of assemblies are air cooling, natural cooling, and water cooling with aluminum profile and heat pipe.
- Components of assemblies are power unit, RC absorption capacitor, temperature protection, general or special control function components.
